Comment on data

Statistic	Brazil	Germany
Goals scored	1	7
Total shots	18	14
Shots on target	8	10
Ball possession	52%	48%
Corner kicks	7	5
Fouls committed	11	14
Offsides	3	0
Yellow cards	1	0
Red cards	0	0

Table 1 Match statistics

[https://en.wikipedia.org/wiki/Brazil_v_Germany_\(2014_FIFA_World_Cup\)](https://en.wikipedia.org/wiki/Brazil_v_Germany_(2014_FIFA_World_Cup))

Statistic	Brazil	Germany
Goals scored	1	7
Total shots	18	14
Shots on target	8	10
Ball possession	52%	48%
Corner kicks	7	5
Fouls committed	11	14
Offsides	3	0
Yellow cards	1	0
Red cards	0	0

As shown in the table, the total number of goals scored was one on the part of the Brazilian team and seven by the German team. The Brazilians achieved 18 shots, whereas the Germans accounted for a lower number of shots, namely 14.

~~ineffective~~

- Adds no value to the reader.
- Tells readers nothing that they could not have deduced for themselves.

Statistic	Brazil	Germany
Goals scored	1	7
Total shots	18	14
Shots on target	8	10
Ball possession	52%	48%
Corner kicks	7	5
Fouls committed	11	14
Offsides	3	0
Yellow cards	1	0
Red cards	0	0

EFFECTIVE

Although a close match was expected – both teams had reached the semi-final undefeated – the result was a shocking loss for Brazil (see Table 1). For what was the first time in football history, Germany scored four goals in the space of six minutes. Despite achieving a greater number of shots, having 4% more possession and committing less fouls, and having only two shots less on target, the Brazilians were humiliated. This result recalls the 1952 final when Brazil were defeated by Uruguay.

When commenting on a table, your job is to:

- **interpret / discuss** the results
- bring to the reader's attention anything that is particularly **meaningful or significant**
- add further details that help to **explain** the results or which enable them to be **compared** with previous results.

TABLE 5. Means of PC Virus Infection in U.S. Businesses

Source	Percentage
Disks from home	43%
Electronic bulletin board	7%
Sales demonstration disk	6%
Repair or service disk	6%
Company, client, or consultant disk	4%
Shrink-wrapped application	3%
Other download	2%
Disk from school	1%
Local area network supervisor disk	1%
Purposely planted	1%
Came with PC	1%
Undetermined	29%

Location + indicative summary

Table 5 shows the most common modes of infection for U.S. businesses. As can be seen, in the majority of cases, the source of viral infection can be detected, with disks being brought to the workplace from home being by far the most significant. However, it is alarming to note that the source of nearly 30% of viral infections cannot be determined. While it may be possible to eliminate home-to-workplace infection by requiring computer users to run antiviral software on diskettes brought from home, businesses are still vulnerable to major data loss, especially from unidentifiable sources of infection. Spending of self-earned money ⁶	12%	27%

¹E.g., may only be allowed out two nights a week.

²E.g., may be allowed only to use the car on special occasions.

³Curfew is imposed; e.g., has to be back by 11 P.M.

⁴E.g., girls are dissuaded from going out with older men.

⁵E.g., persuaded to study for a professional degree in college.

⁶E.g., required to bank 50% of earnings.

- Fifty-six percent of girls reported restrictions on going out late at night **as opposed to** 35% of boys.
- **More** girls reported restrictions on going out late at night than did boys.
- **Twenty-one percent more** girls reported restrictions on going out late at night.

- Almost **exactly twice as many** boys reported...
- A **marginally smaller** percentage of girls reported...
- **Slightly over twice as many** boys reported...
- **Close to three times as many** boys reported...
- Boys **exceeded** girls in the times they reported... **by a ratio of 2.5 to 1.**

Concluding a Commentary– Dealing with “Problems”

The difference between expected and obtained results	may be due to	the incorrect calibration of the instruments.
The discrepancy	can be attributed to	the small sample size.
The anomaly in the observations	can probably be accounted for by	a defect in the camera.
The lack of statistical significance	is probably a consequence of	weakness in the experimental design.
The difficulty in dating this archeological site	would seem to stem from	the limited amount of organic material available.

- The errors may be **due to** incorrect calibration of the instruments.
- The errors may be **due to** the fact that the instruments were incorrectly calibrated.
- The errors may be **due to** the instruments being incorrectly calibrated.
- The errors may be **due to** the instruments were incorrectly calibrated.
- The errors may be **due to** incorrectly calibrating the instruments.

Table 1. Percentage of girls and boys displaying aggressive behavior

<i>Aggressive behavior</i>	<i>Girls</i>	<i>Boys</i>
Pushing	21%	35%
Kicking/Hitting	15%	61%
Cursing	9%	30%
Chasing	78%	1%

- x Fail to distinguish the more important facts from the less important ones.
- x Fail to evaluate.
- x Fail to discuss or explain.

In order to investigate the hypothesis that 8-year old boys are more aggressive than 8-year old girls, 8-year old children were observed playing in schoolyards and incidents of certain aggressive behaviors were recorded. Table 1 shows that boys are more aggressive than girls. The percentage of pushing is 21 % of girl; on the other hand that of boys is 35%. Except for chasing, the percentage of aggressive behavior is higher in boys. From this data you can agree that boys are more aggressive than girls.

Table 1. Percentage of girls and boys displaying aggressive behavior

<i>Aggressive behavior</i>	<i>Girls</i>	<i>Boys</i>
Pushing	21%	35%
Kicking/Hitting	15%	61%
Cursing	9%	30%
Chasing	78%	1%

- ✓ qualify his statement
- ✓ construct something new

In order to investigate the hypothesis that 8-year old boys are more aggressive than 8-year old girls, 8-year old children were observed playing in schoolyards and incidents of certain aggressive behaviors were recorded. It was assumed that aggressive behavior consisted of the following: i) pushing, ii) kicking and hitting, iii) cursing, and iv) chasing. As can be seen from the table above, the average 8-year old boy was more aggressive than the 8-year old girls. Chasing was the one behavior that was more pronounced for the girls. This result, however, does not disprove the theory since chasing seems to be a less aggressive behavior than the other behaviors that were tested. The 8-year old boys got more involved with the more aggressive behavior, which is kicking/hitting, much more than the 8-year old girls.

Global stocks drop after Trump risks 'full-on' trade war with China

By **Rob McLean and Julia Horowitz,**
CNN Business

Updated 1 hour ago 5月 6, 2019

New York (CNN Business) - President Donald Trump sent shivers through global markets on Monday, with stocks plunging after he threatened new tariffs that would escalate the US-China trade war.

The Shanghai Composite plunged 5.6%, while Hong Kong's Hang Seng fell nearly 3%. The Stoxx Europe 600 index opened down 1.2%. Oil futures dropped while gold prices increased.

US stock futures also pointed to a slump. The S&P 500 was set to open down nearly 1.6%, while the Nasdaq was poised to fall 1.8%.

Dow Industrials Plummet Nearly 3,000 Points

By Caitlin McCabe,
Anna Hirtenstein
and
Chong Koh Ping

The Dow Jones Industrial Average plunged nearly 3,000 points Monday—its steepest decline of the monthlong sell-off—reflecting fear the emergency measures taken by the Federal Reserve may not be enough to ward off a coronavirus-induced recession.

The decline underscores the level of worry among investors since the pandemic escalated and disrupted supply chains, sidelined workers and infected tens of thousands of people world-wide. To combat the potential economic fallout, central banks and governments have put in place various stimulus measures.

Those efforts, so far, have yet to stem the selloff. The S&P 500 is down 30% from its peak reached less than a month ago. Shares in the two largest U.S. companies by market value—Apple Inc. and Microsoft Corp.—each dropped more than 12% Monday.

"This is what panic looks like," said Patrick Healey, president and founder of Caliber Financial Partners. "It doesn't matter what the Fed did over the weekend or what they could have done, the trading

activity in the market is reflective of fear and uncertainty.

"The only thing that is going to calm markets is seeing the number of [coronavirus] cases go down," he said.

The steep fall in stocks sent investors scrambling toward U.S. government bonds, with the 10-year Treasury's yield posting its largest one-day decline since 2009. The benchmark crude price, meanwhile, fell to a four-year low.

The blue-chip stock index plummeted 2997.10 points, or 13%, to 20188.52, marking the

Dow Soars 11%, Best Day in 87 Years

Rally fueled by hope that lawmakers are nearing an agreement on a stimulus package

The Dow Jones Industrial Average surged more than 11% Tuesday, its biggest one-day

By Alexander Osipovich,
Caitlin Ostroff
and Joanne Chiu

gain since 1933, on signs that lawmakers were nearing a deal on a stimulus package to ease

the economic fallout from the coronavirus pandemic.

Major indexes opened sharply higher after Treasury Secretary Steven Mnuchin and Sen. Chuck Schumer of New York, the Democratic leader, emerged from late-night negotiations saying they were within striking distance of a deal.

Stocks continued climbing throughout the day and closed near session highs. Senate Majority Leader Mitch McConnell (R., Ky.) voiced hope Tuesday that a deal would get done later in the day. The stimulus package is expected to be

worth at least \$1.6 trillion.

"Markets are definitely reacting to the prospects of a stimulus deal," said Jason Pride, chief investment officer for private wealth at Glenmede.

The blue-chip index gained 2,112.98 points to close at 20704.91. It was the biggest one-day percentage gain for the blue-chip index in 87 years and its largest-ever move in point terms.

The S&P 500 climbed 209.93 points, or 9.4%, to 2447.33. The tech-heavy Nasdaq Composite rose 557.18 points, or 8.1%, to

The pandemic has changed the shape of global happiness

In Britain, a country with excellent happiness data, everyone has **slipped**, but some more than others (see figure 1). There, and in other rich countries, the age profile of happiness before the pandemic struck **was roughly U-shaped when plotted on a graph**. People began their adult lives **in a cheerful state**. They became **glummer** in middle age. Then, after about the age of 50, they started to become happier again. If they made it to a very advanced age, however, they **fell back into the doldrums**.

Today the pattern is an upward slope. The young **are less satisfied than** the middle-aged, who **are less satisfied than** the old.

Married Men Sit Atop the Wage Ladder

by Guillaume Vandenbroucke

Figure 1
Wage and Salary Income of Employed Men and Women with
at Least a High School Diploma, 2016

SOURCE: IPUMS-USA, University of Minnesota; www.ipums.org.

Data show that the average male worker earns a higher wage than the average female worker. Figure 1 illustrates this: It plots the wage and salary income of men and women, by age. The sample represented here includes all men and women employed in 2016 with at least a high school diploma.

A few details are worth pointing out with this figure. First, wages tend to increase with age—at least up until age 50. This is presumably because people accumulate human capital as they work and, therefore, become more productive. Second, for both men and women, there is a tendency for wages to decrease in the latter years of their working lives—that is, after age 50. This is probably because, by then, workers devote less effort to accumulating new human capital. Finally, the salary difference between men and women is noticeably less pronounced earlier in life rather than later in life.

Married Men Sit Atop the Wage Ladder

by Guillaume Vandenbroucke

Figure 2
Wage and Salary Income of Employed Men and Women with at Least a High School Diploma, 2016, by Marital Status

Figure 2 offers a decomposition of the data in Figure 1. It plots the wage and salary income of workers with at least a high school diploma by age, gender, and marital status.

Figure 2 presents many striking features. First, there are almost no gender differences in wages among single (that is, never-married) workers: Whether they are men or women, single workers earn very similar wages. Second, married and single women also earn similar wages. This is surprising since married women may be more likely to have children than single women. Thus, this second point is not consistent with the view that the gender wage gap results from women having children earlier in life and losing ground in human capital accumulation relative to men. Finally, married men earn wages that dominate those of the other three categories; that is, married men earn higher wages than single or married women, and married men earn higher wages than single men.

It is well known that parenthood tends to hurt women's careers but not men's. Numerous studies have shown that as a group, having children lowers women's lifetime earnings, an outcome known as the "child penalty". A wide range of individual decisions account for this effect. Some women work fewer hours, or not at all, when their children are young. Others switch to jobs that are more family-friendly but lower-paid. There is also substantial variation in the size of the earnings decline, ranging from zero all the way up to 100% (in the case of women who stop working altogether).

They defined the child penalty as the amount by which women's earnings fell behind those of men after having children.

好男人都结婚了吗?——探究我国男性工资婚姻溢价的形成机制

王智波; 李长洪

[华南师范大学经济与管理学院](#)

本文利用1989—2009年中国健康与营养调查数据(CHNS)研究我国男性工资婚姻溢价及其产生的原因。本文发现在控制相关特征变量之后,在婚男性工资比非在婚男性工资显著高出6.8%。究其原因,本文发现我国的男性婚姻溢价无法使用婚后家庭内部专业化分工、男性婚后责任感增强以及女性选择优秀的男性作为配偶来解释,但是可以由妻子的"相夫"特征所解释。这一发现传递出正能量,同等条件下已婚男性收入更高,不是因为好男人都结婚了,而是因为结婚了,他才成为好男人。

Relative Income and Mental Health in Couples

Abstract

The share of couples where the wife outearns the husband is increasing globally. In this paper, I examine how this dynamic affects mental health. Using data on the 2001 marital cohort in Sweden, I show that while mental health is positively associated with own and spousal income, it is negatively linked to the wife's relative income. In the most conservative specification, the wife starting to earn more increases the likelihood of a mental health diagnosis by 8%–11%. This represents a significant indirect cost of changes in family dynamics.

In this paper, I examine the link between spousal income and mental health. I find that the wife outearning the husband results in higher incidence of mental health issues for both spouses. The effect is more pronounced for males, with an approximately 11% increase in the probability of a diagnosis. This occurs despite mental health being positively associated with both own and spousal earnings for both genders.

Mental health is a crucial outcome linked to a host of important economic and life outcomes. In this study, I find tangible evidence of relative income in couples playing an important role in mental health outcomes, even in an ostensibly more egalitarian society like Sweden.

All the Single Ladies: Job Promotions and the Durability of Marriage

Olle Folke⁺ and Johanna Rickne^ψ

This paper addresses women's under-representation in top jobs in organizational hierarchies. We show that promotions to top jobs dramatically increase women's probability of divorce, but do not affect men's marriages. This effect is causally estimated for top jobs in the political sector, where close electoral results deliver exogenous variation in promotions across job candidates. Descriptive evidence from job promotions to the position of CEO shows that private sector promotions result in the same gender inequality in the risk of divorce. A description of male and female job candidates' household formations sheds some light on the mechanism behind this result. For most male candidates for top jobs, their promotion aligns with the gender-specialized division of paid and unpaid labor in their households. Many female candidates for top jobs live in dual-earner households and are married to older husbands who take a small share of parental leave. Divorce among women in top jobs occurs more often in couples with a larger age gap and a less equal division of leave, and in households in which her promotion shifts the division of earnings (further) away from the norm of male dominance. No divorce effect is found in couples that are more gender-equal in terms of having a smaller age gap and a more equal division of parental leave. We argue that norms and behavior in the marriage market hinder the closure of the gender gap in the labor market.

Having Less Than Others is Physically Painful: Income Rank and Pain Around the World

Physical pain is a pressing issue for scientists and policymakers. Yet evidence on the psychosocial factors of pain is limited. Using data from 146 countries (N = 1.3 million individuals), this article documents the role of income comparisons on physical pain. Specifically, **this study shows that income rank (i.e., the ordinal position of a person's income within a comparison group) is linked to physical pain above and beyond absolute income.** This effect is identical in rich and poor nations. The negative emotions that result from a disadvantaged relative standing in the income hierarchy may explain these findings. This article documents a new kind of evidence on the power of income comparisons and highlights the role that psychosocial factors may play in physical pain.

Reading research papers

Introduction

1. Introducing the Topic:

- Phenomenon of pet owners spending significantly on their pets
- Economic growth of the pet industry

2. Reviewing Existing Research:

- Benefits of pet ownership for physical and mental health
- Importance of fulfilling the need to belong for happiness

3. Pet Spending to Boost Happiness

4. Stating the Hypothesis:

- Spending money on pets promotes happiness

Experiment 1

- **Methods:** Recall experiment
- **Results:**
 - Pet owners reported higher levels of happiness when recalling a time they spent money on their pet.
 - Those in the prosocial spending condition did not report higher level of happiness.
- **Discussion:**
 - This experiment provided initial evidence that spending on pets can boost happiness.

Experiment 2

- **Methods:** Field Experiment
- **Results:**
 - Pet owners who actually spent on their pets reported greater happiness than those who spent it on themselves or others.
- **Discussion:**
 - This experiment replicated and extended the findings of Experiment 1 using real-world spending scenarios.
 - The effect of pet spending may be specific to feelings of happiness rather than broader positive emotions or elevated mood.

General Discussion

1. Recap of Findings:

2. Comparison with Prosocial Spending:

3. Future Research Directions:

- Exploring whether spending strategies effective in human relationships also apply to pet relationships
- examining potential moderators of the effect, such as the frequency and amount of spending

Conclusion:

- Emphasizing the importance of the findings for pet owners
- Suggesting that spending money on pets can be a valuable strategy for enhancing happiness and well-being.
