Unit 1: Learning Objectives

Understanding research papers

Research paper

- It is ...
- It is not ...

What it is not

- × Not simply an informed summary of a topic
- × Not a book report
- × Not an opinion piece
- × Not an overview of a particular topic
- × Not an expository essay consisting solely of one's interpretation of a text

What it is

- The culmination and final product of an involved process of research, critical thinking, source evaluation, organization, and composition
- To offer a unique perspective on the issue at hand
- Using both primary and secondary sources

How to Write a Research Paper

For a paper to stand out, the research needs to deliver clear writing, provide sound data and comprehensive information. Follow these simple steps and resources to write a strong research paper.

Step 1

Choose a research topic

Get familiar with instructions, explore themes and pick a paper topic that suits the guidelines and is interesting for you and readers.

Step 2

Search for information

Visit the library, browse the Internet, talk to a professor, look through articles and books to find suitable sources for your chosen topic.

Step 3

Create a thesis statement

Scan through the issues that occur within your topic and create an arguable thesis statement that should reflect your main ideas.

Organize your notes

Arrange the materials you have gathered according to your outline and critically analyze your research data, verify their accuracy.

Step 5

Step 4

Complete an outline

Plan your future paper by outlining its sections that will concern the major points of your research. An outline helps stick to the structure.

Step

Python C# PHP C++

Quantitative methods

- Quantitative methods are those which focus **on numbers and frequencies** rather than on meaning and experience.
- Quantitative methods provide information which **is easy to analyse statistically and fairly reliable**.
- Quantitative methods are associated with the scientific and experimental approach and are criticised **for not providing an in depth description**.

Qualitative methods

- Qualitative methods are ways of collecting data which are concerned with **describing meaning**, rather than with drawing statistical inferences.
- Qualitative data analysis is the range of processes and procedures whereby we move from the qualitative data that have been collected into some form of **explanation, understanding or interpretation** of the people and situations we are investigating.
- The idea is to examine the **meaningful and symbolic content** of qualitative data.

Two kinds of research

Quantitative Research

- Predominant in science, medicine, and engineering but can be found in any field
- Usually consists of numerical data and measurements, and can include statistical analysis
- Seen as more objective

Are you hurt? Y/N

Qualitative Research

- Common in arts and social science
- Involves gathering and interpreting non-numerical data, such as interviews, surveys, or observation
- Seen as more subjective

How does pain make you feel?

Exploring the structure of research papers

Title

Contagious yawning in chimpanzees

Abstract

Six adult female chimpanzees were shown video scenes of chimpanzees repeatedly yawning or of chimpanzees showing open-mouth facial expressions that were not yawns. Two out of the six females showed significantly higher frequencies of yawning in response to yawn videos; no chimpanzees showed the inverse. Three infant chimpanzees that accompanied their mothers did not yawn at all. These data are highly reminiscent of the contagious yawning effects reported for humans. Contagious yawning is thought to be based on the capacity for empathy. Contagious yawning in chimpanzees provides further evidence that these apes may possess advanced self-awareness and empathic abilities.

Keywords

Keywords: chimpanzees; contagious yawning; videotape; development; self-awareness; empathy

Introduction

1. INTRODUCTION

Experimental evidence supports the common observation that seeing other people yawn can induce yawning (Provine 1986, 1989; Platek *et al.* 2003). Studies have shown that between 42% and 55% of human adults will yawn during, or shortly after, seeing a videotape of repeated yawns of other humans. The only systematic study to our knowledge of children, however, found that children aged younger than 5 years do not show this contagious yawning effect (Anderson & Meno 2003). Although yawning is widespread among vertebrate species, contagious yawning has been reported only in humans (Lehmann 1979; Baenninger 1987; Smith 1999). It has been suggested that contagious yawning reflects a basic capacity for empathy (Lehmann 1979), and a recent study linked human individual differences in susceptibility to contagious yawning to differences in empathic tendencies, self-recognition ability and theory of mind (Platek *et al.* 2003). We assessed whether chimpanzees—humans' nearest phylogenetic neighbours—are prone to contagious yawning when exposed to videotapes showing yawning of conspecifics. Evidence of contagious yawning would provide further evidence of similarities in the evolution of self- and other-awareness between great apes and humans.

Material and method

2. MATERIAL AND METHODS

(a) Subjects

We tested six socially reared, group-living adult female chimpanzees (*Pan troglodytes*) living at the Primate Research Institute of Kyoto University. They were individually invited to leave their outdoor

enclosure and enter a familiar test booth; three of them brought their 3-year-old dependent infants with them. The chimpanzees had extensive experience with experiments on learning and cognition (Matsuzawa 1985, 2003; Kawai & Matsuzawa 2000; Morimura & Matsuzawa 2001), but none had previously observed video stimuli of the type used here. This experimental work complied with the Guide for the Care and Use of Laboratory Primates, Primate Research Institute, Kyoto University.

(b) Experimental apparatus

We prepared two 'yawn' and two 'open-mouthed' videotapes. Yawn videos contained 10 naturally occurring yawns by chimpanzees, each separated by 6–10 s of a blue, blank screen (see figure 1 for an example). Open-mouthed videos were equated for total duration, and showed chimpanzees displaying eight or ten open-mouthed faces but not yawning (for example, while pant-hooting or grinning), again separated by a blank screen. The videos displayed chimpanzees in various postures and orientations, the most salient feature being the yawns or open-mouthed expressions. One yawn video presented yawns by familiar chimpanzees from the subjects' own group, and the other presented yawns by unfamiliar chimpanzees in the wild. The videos were shown silently on a 35 cm monitor (Panasonic TH-14RP2) positioned on a small table 30 cm high and ca. 8 cm from the front of the glass-walled booth.

(c) Experimental procedure

Two videotapes were shown in each session. Five minutes after the chimpanzee entered the booth, the monitor was switched on and the first video ran until completion of the last yawn or open-mouth (3 min). The monitor was then switched off and the chimpanzee was observed for 3 min. A 5-min distraction period followed, after which the second video was shown (3 min), followed by another 3-min observation period. Each chimpanzee was tested during four sessions, with the following order of video combinations presented in each session: (i) familiar yawn, unfamiliar open-mouth; (ii) unfamiliar open-mouth, familiar yawn; (iii) familiar open-mouth, unfamiliar yawn; (iv) unfamiliar yawn, familiar open-mouth. All sessions were videotaped through the glass walls of the booth, using three fixed position cameras, two of which were operated manually. The three authors were present but remained passive throughout, except that T.M. occasionally encouraged the chimpanzee to watch the monitor if her attention appeared to wane. All yawns by the subject chimpanzees were scored in real time and then verified by subsequent video analysis; agreement between the three authors was 100%.

3. RESULTS

The adult chimpanzees yawned, on average, 4.7 times during and after the open-mouth videos, and this rose to 10 yawns during and after the yawn videos. The data were analysed both at the group level and individual level. There were no significant effects at group level, as assessed by paired *t*-tests. However, two chimpanzees (Ai, Mari) showed significantly higher frequencies of yawning during or shortly after exposure to yawn videos (24 and 25) than to open-mouth videos (2 and 9; both $p < 0.01$, binomial tests). Figure 1 shows a chimpanzee yawning during exposure to a yawn video, and figure 2 presents the data for all of the adult chimpanzees. Social familiarity of the chimpanzees in the videos did not affect yawning frequency. No chimpanzee showed significantly more yawning in response to the open-mouth videos, and open-mouth videos did not elicit facial expressions. None of the three infant chimpanzees yawned at any time during the tests.

4. DISCUSSION

Higher frequencies of yawning in response to yawn stimuli compared with the open-mouth control stimuli indicate a contagion effect in 33% of the adult chimpanzees. This percentage is only slightly lower than the percentages reported for adult humans exposed to visual yawn stimuli (Provine 1986; Platek *et al.* 2003). It can be argued that the percentage of chimpanzees showing contagious yawning is even more impressive, given that adult human participants are usually aware of the phenomenon

Figure 1. A yawn response during presentation of a yawn videotape. Ai watches a yawn on the screen (top left), starts to yawn as the stimulus yawn ends (top right), continues to yawn (bottom left), and completes the yawn while the screen is blank (bottom right). See electronic Appendix A.

Figure 2. Total frequency of yawns by six adult female chimpanzees during or after exposure to open-mouth videos (open bars) and yawn (filled bars) videos. Ages in years are given in parentheses. A plus sign indicates females that were tested with their infant. *** $p < 0.01$; **** $p < 0.001$.

Discussion

Three infant chimpanzees that accompanied their mothers showed any yawning, even though they watched the videos and saw their mothers yawning. This absence of contagious yawning in infant chimpanzees recalls the absence of contagious yawning in human toddlers reported by Anderson & Meno (2003). Further work on the young chimpanzees will clarify the extent to which contagious yawning in chimpanzees resembles the same behaviour in humans. Chimpanzees display self-recognition in mirrors (Gallup 1970; Povinelli *et al.* 1997), a sign of objective self-awareness that has been linked with the capacity for empathy

Acknowledgements

(Gallup 1982). Monkeys do not show self-recognition (Anderson 1994), and observations of social behaviour reveal much more convincing evidence of empathy in chimpanzees than in monkeys (de Waal 1996). Observational studies of spontaneous yawning in monkeys indicate that it is not contagious (Baenninger 1987; Baenninger 1994). Given the distribution of social cognitive abilities among primates, susceptibility to contagious yawning may be great apes, but not monkeys, and the differences in susceptibility to contagious yawning related to differences in self-recognition and empathy.

Acknowledgements

The present study was financially supported by the following grants: (07102010, 12002009, 21COE-A2-Kyoto University, JSPS-HOPE). Thanks are due to Mito Hayashi, Yumi Mizuno, Masaki Tomomaga, Masayuki Tanaka and Juri Suzuki for their assistance and support. We are grateful to Miho Nakamura for providing the videotapes of yawning by Mahale and Pili chimpanzees.

What is plagiarism?

plagiarism

Latin word

→ *plagium*

kidnapping

"The practice of taking someone else's work or ideas and passing them off as one's own" (Lexico, n.d.).

Turn

What?

What is plagiarism?

“Plagiarism, specifically, is a term used to describe a practice that involves **knowingly** taking and using another person’s work and **claiming it, directly or indirectly, as your own.**”

Neville, Colin. (2010). *The Complete Guide to Referencing and Avoiding Plagiarism* (2nd Edition). New York: Open University Press, p. 30.]

- It can be argued that all imitative learning is plagiarism.
- Every institution develops its own definitions and even within these there can be a range of interpretations of what it is – and is not.

Neville, Colin. (2010). *The Complete Guide to Referencing and Avoiding Plagiarism* (2nd Edition). New York: Open University Press, p. 29.]

What?

What is plagiarism?

Scenario 1

Student A copied a sentence from a research paper and used the sentence in his paper without citing the source.

Scenario 2

Student B copied a sentence from a research paper and used the sentence in his paper. He used the author's original words without quotation marks, but he added the reference of the source.

Scenario 3

Student C copied a paragraph from her own published research article. As she was the author of the source text, she didn't cite it.

第三章 严谨认真

第十一条 在科研工作中应保持严谨的态度和作风。

第十二条 成果表述应客观。一旦发现作品（印刷中或已公开出版）中有疏漏或错误，作者有义务及时向相关人员和机构报告，根据错误性质实施有效补救措施（如勘误、补遗或撤回论文）。

第十三条 提出重大创新理论须提供确凿的事实根据和理论论证；对可能造成重大社会或环境影响的应用研究，必须进行科学和伦理两方面论证。未经严格科学验证或同行评议的研究结果，不得在公众媒体炒作，也不得草率地推广应用，以免造成科学资源的浪费和破坏性的社会后果。

第十四条 不得为未经严格科学检验的不成熟的科研成果作商业广告，误导消费，损害公众利益。

第四章 公开、保密与知识产权

第十五条 遵守国家有关保密和知识产权的法律、法规以及《清华大学保护知识产权的规定（试行）》。

第十六条 维护他人知识产权，不使用、不复制盗版出版物、影像制品和软件等产品。尊重他人尚未获得知识产权的成果，保护本人尚未获得知识产权的成果。

第十七条 在保密和知识产权保护的前提下，遵照数据共享、思想共享、理论共享和成果共享的科学公开原则，加强交流与讨论，接受学术界检验。

第十八条 积极履行向公众传播科学知识、纠正各种错误思想和观点的义务，提高公众的科学鉴赏力。

第五章 引文规范

第十九条 引证内容不得构成创造性作品的主要部分或核心内容。

第二十条 在论文、著作、项目申请书、研究报告等作品的实质部分，引用须获得原作者准许或以适当形式予以注明。

第二十一条 不得将未查阅过的文献转抄入自己的引文目录或参考文献目录中，不得为增加引证率而将自己（或他人）与本论题不相关的文献列入引文目录。

第六章 署名权与鸣谢

第二十二条 只有对研究成果做出实质性贡献（从选题、设计、实验、计算到得出必要结论的全过程中完成重要工作）者，才有资格在论文上署名。对虽对研究有帮助但无实质性贡献的人员应予鸣谢，不宜列入作者名单。

第二十三条 对于确实在可署名成果中做出重大贡献者，除应本人要求或保密需要外，不得以任何理由剥夺其署名权。

第二十四条 对于合作研究的成果，应按照对研究成果创造性的贡献大小，或根据学科署名的惯例，确定合作成果完成单位和作者（专利发表人、成果完成人）署名顺序。

Actor hit by accusations of academic plagiarism

By Xu Keyue Source: Global Times Published: 2019/2/10 21:23:39

A Chinese TV actor, who also has a PhD from Beijing Film Academy and is a postdoctoral candidate at Peking University, found himself in hot water recently after allegations of plagiarism, which kicked off a new wave of discussions over academic misconduct in China.

Sina Weibo user "PITDyazhounuedaiboshizuzhi" on Saturday accused Zhai Tianlin, 32, who most recently appeared in China's 2019 Spring Festival Gala on China Central Television, of plagiarism on Sina Weibo. The user uploaded a paper by Zhai, which was published in an academic journal in August 2018, to a plagiarism software platform. The similarity score for the 2,783-word article was 40.4 percent after it was put through the China National Knowledge Infrastructure (CNKI), a similar platform to Google Scholar, according to the Weibo post.

Zhai has been mired in controversy since he asked in a live video in August 2018 what the CNKI was.

Exploring University Students' Perceptions of Plagiarism: A Focus Group Study

Judith Gullifer* and Graham A. Tyson

School of Social Sciences and Liberal Studies, Charles Sturt University, NSW, Australia

Plagiarism is perceived to be a growing problem and universities are being required to devote increasing time and resources to combating it. Theory and research in psychology show that a thorough understanding of an individual's view of an issue or problem is an essential requirement for successful change of that person's attitudes and behaviour. This pilot study explores students' perceptions of a number of issues relating to plagiarism in an Australian university. In the pilot study, focus groups were held with students across discipline areas, year and mode of study. A thematic analysis revealed six themes of perceptions of plagiarism: confusion, fear, perceived **sanctions**, perceived seriousness, academic consequences and resentment.

Keywords:

academic integrity; college students; plagiarism; student ethics; university student

Focus group

- A research method using the discussion generated among participants
- Ideally six to eight participants
- Focuses on a preselected topic
- The goal is not to reach consensus among the participants or to engage in debate
- The goal is for each participant to share his or her perspective

Focus group

Advantages:

It is **quick, cheap and relatively easy to assemble**. Good for getting rich data in participants' **own words and developing deeper in sight**. People are able to build on others' responses and come up with ideas they might not have thought of in a one on one interview. They are very **cost effective** in terms of gathering primary data and are very much time efficient.

Limitations:

Pretense, political correctness, and outright lying by group members can undermine the value of focus groups. Also, some participants may have **difficulty articulating their true feelings**.

Plagiarism is perceived to be a growing problem and universities are being required to devote increasing time and resources to combating it.

Theory and research in psychology show that a thorough understanding of an individual's view of an issue or problem is an essential requirement for successful change of that person's attitudes and behaviour.

This pilot study explores students' perceptions of a number of issues relating to plagiarism in an Australian university.

In the pilot study, focus groups were held with students across discipline areas, year and mode of study.

A thematic analysis revealed six themes of perceptions of plagiarism: confusion, fear, perceived sanctions, perceived seriousness, academic consequences and resentment.

FINDINGS

Thematic analysis

- A model of narrative analysis
- Examines what is said rather than how it is said (Riessman, 2004)
- Looks for recognizable reoccurring topics, ideas, or patterns (themes) (Allen, 2017)

Structure of the RP

outline

Introduction

- Definition of plagiarism
- Consequences of plagiarism
- Necessity of understanding students' perspective regarding plagiarism

Aim of the study: to systematically examine students' understandings of, and attitudes towards, plagiarism, with the intention of informing the institution on approaches that might promote a greater awareness of plagiarism and, therefore, prevent its occurrence.

Literature review

- Previous studies and their limitations
- Research gap: little systematic research has been done on the topic of understanding student perceptions of what plagiarism is, and most has been conducted in the USA or the UK.
- Aim of the study: to develop a better understanding of how students construct plagiarism by using group discussion to explore the range of opinions regarding students' perceptions of plagiarism

Method

- Design: focus group study, qualitative data
- Participants: N=41, 7 focus groups
- Materials: semi-structured, open-ended interviews
- Procedures: piloting interview first
- Data analysis: theme analysis, credibility check

M

Analysis/discussion

- Six themes were identified

confusion
fear
perceived sanctions,
perceived seriousness
academic consequences
resentment

R+D

conclusion

- The university's approach towards plagiarism is not effective.
- Implication of the study
- Litiation of the study
- Suggestion for further study

IMRD is more of an organizational philosophy than a strict formatting rule.

How strict is this?

- Is this structure a rule? Do you think that every possible qualitative or quantitative research article for any subject must use this framework?
- What variations could there be? What could this depend on? (quantitative vs qualitative, science vs economics vs literature, etc.)

Introduction

general area

root and nature of the issue of plagiarism

research niche

**university students plagiarism
& adverse consequences**

specific study

**university students'
perceptions of plagiarism**

the present study

General

Specific

Introduction

Rationale: Since the 1960s, and particularly in today's technologically advanced society, academic dishonesty (for example, cheating, **collusion** and plagiarism) continues to attract considerable attention from the media, academics, administrators and students. It has been suggested that academic dishonesty is growing, requiring universities to devote increasing time and resources to combat it.

Solution: to gain a better understanding of students' perceptions, and then develop appropriate strategies with an increased probability of effectiveness.

Argument: There is merit in understanding students' perspectives regarding plagiarism in order to develop successful strategies to promote academic integrity and thereby prevent plagiarism.

Significance: Universities can benefit from learning about their own students' perceptions of plagiarism in order to develop appropriate strategies to promote academic integrity.

Objectives: to systematically examine students' understandings of, and attitudes towards, plagiarism, with the intention of informing the institution on approaches that might promote a greater awareness of plagiarism and, therefore, prevent its occurrence.

Introduction

Previous Studies

	Findings	Weakness/Limitations/Gaps
Group 1	• Possible reasons for student plagiarism	• Focus on individual characteristics; • Need to examine contextual factors
Group 2	• Students' good understanding of institutional policy can reduce plagiarism	• Amount of studies is small; • Study focuses are limited
Group 3	• Useful model for research design; • useful conclusions relating to students' understanding of plagiarism	• Small sample pool; • Need to go deeper into students' understanding of plagiarism
Group 4	• Need to examine situational or contextual variables	• Little relevant systematic research; • Most of the previous research was conducted in the US&UK
